ABSTRACT

[In order to provide a bright, colour, simple matrix-type electroluminescent element which can be manufactured by means of a simple process, banks 4 required for fabricating organic films head in an electroluminescent element by means of an ink-jet are formed such that they intersect orthogonally with anodes 6, and patterning of cathodes 1 is carried out using these banks. By means of this composition, cathode patterning becomes possible without increasing the number of processes. Therefore, it becomes possible to manufacture a full-colour simple matrix-type electroluminescent element, inexpensively.] A method for manufacturing an electroluminescent element. The method includes forming a first electrode group by a predetermined arrangement of a plurality of first electrodes on a substrate, forming a bank group by a predetermined arrangement of a plurality of banks intersecting with the first electrode group, forming an electroluminescent material layer by filing the electroluminescent material in between banks by means of an ink-jet method, and forming a second electrode group separated by the banks by depositing a second electrode material onto the electroluminescent material layer.
